

Radiation Tests: LT3080 Voltage Regulator

- TID and SEE tests performed together at a flux of 2.4×10^8 p/cm²/s
 - Output voltages of the chips were being monitored
 - A maximum of 5% increase in output voltages were observed (no effect on brick's performance)
 - Some SETs were observed, with small amplitude (max 500 mV) and short duration (~20 us), but with no effect on brick's performance
- **NIEL tests showed no issues**
- As failures on this chip were observed by other groups at CHARM facility, it was asked to retest these chips at a mixed field
 - **Tests at CHARM showed no failures** up to 835 Gy and 6.57×10^{12} n/cm²
